(54) SERVICE REVERSE AUCTION SYSTEM

(57) Abstract:

PURPOSE: A service reverse auction system is provided so that a user can select a service easily and receives the selected service with speed by providing a necessary service with a desired price. CONSTITUTION: A service reverse auction system includes several steps. In an on-line, a user designates a kind and condition of service. A step is to determine a successful bidder corresponding to the condition provided by a server and thereafter contract and deposit a reservation amount of money as a first payment. When the bidder finishes the service, the bidder settles a reservation amount of money and an amount of balance of money. A credit standing is evaluated with credit of the settlement of the server of user and a credit of working of a man providing the service and stored to the manager server. When finishing on-line service, the user settles to the bidder by cash or one of cash or cyber money. The on-line is an internet network. The manager server (107) requires settlement/credit evaluation information (S329), the information is provided to a man providing a service among a plurality of bidders (121).
